

# Queen Titania suspension lamp

The edition in an extra-large format of an icon of Luceplan production. Twice as large in its dimensions and its visual impact, Queen Titania has been designed to light large areas. The aluminium lamellar shell is made up of an ordered sequence of aluminium ribs, which reflect and dematerialise the source of light. The lamp assumes different shapes depending on its angle: transparent seen head on, solid seen from the side. The use of a pair of filters to the sides of the source of light allows the body of the lamp to change colour without interfering with the emission of white light.
